

Smart Digital Magnetometer HMR2300

The Honeywell HMR2300 is a three-axis smart digital magnetometer to detect the strength and direction of an incident magnetic field. The three of Honeywell's magneto-resistive sensors are oriented in orthogonal directions to measure the X, Y and Z vector components of a magnetic field. These sensor outputs are converted to 16-bit digital values using an internal delta-sigma A/D converter. An onboard EEPROM stores the magnetometer's configuration for consistent operation. The data output is serial full-duplex RS-232 or half-duplex RS-485 with 9600 or 19,200 data rates.

Applications include: Attitude Reference, Compassing & Navigation, Traffic and Vehicle Detection, Anomaly Detection, Laboratory Instrumentation and Security Systems.

A RS-232 development kit version is available that includes a windows compatible demo program, interface cable, AC adapter, and carrying case.

Honeywell continues to maintain product excellence and performance by introducing innovative solid-state magnetic sensor solutions. These are highly reliable, top performance products that are delivered when promised. Honeywell's magnetic sensor solutions provide real solutions you can count on.

FEATURES & BENEFITS

- ▶ High Accuracy Over ± 1 gauss, $< 0.5\%$ Full Scale
- ▶ Range of ± 2 gauss, $< 70 \mu\text{gauss}$ Resolution
- ▶ Three Axis (X, Y, Z) Digital Outputs
- ▶ 10 to 154 Samples Per Second, Selectable
- ▶ RS-232 or RS-485 Serial Data Interfaces
- ▶ PCB or Aluminum Enclosure Options
- ▶ 6-15 volt DC Unregulated Power Supply Interface

HMR2300

SPECIFICATIONS

DATA COMMUNICATIONS

The RS-232 signals are single-ended unidirectional levels that are sent received simultaneously (full duplex). One signal is from the host personal computer (PC) transmit (TD) to the HMR2300 receive (RD) data line, and the other is from the HMR2300 TD to the PC RD data line. When a logic one is sent, either the TD or RD line will drive to about +6 Volts referenced to ground. For a logic zero, the TD or RD line will drive to about -6 Volts below ground. Since the signals are transmitted and dependent on an absolute voltage level, this limits the distance of transmission due to line noise and signal to about 60 feet.

When using RS-485, the signals are balanced differential transmissions sharing the same lines (half-duplex). This means that logic one the transmitting end will drive the B line at least 1.5 Volts higher than the A line. For a logic zero, the transmitting end will drive the B line at least 1.5 Volts lower than the A line. Since the signals are transmitted as difference voltage level, these signals can withstand high noise environments or over very long distances where line loss may be a problem; up to 4000 feet. Note that long RS-485 lines should be terminated at both ends with 120-ohm resistors.

Another precaution on RS-485 operation is that when the HMR2300 is in a continuous output mode of operation, the host PC may have to send repeated escape and carriage return bytes to stop the stream of output data. If the host can detect a received carriage return byte (0D hex), and immediately send the escape-carriage return bytes; then a systematic stop of continuous output is likely. If manually sent, beware that the half-duplex nature of the interface corrupt the HMR2300 outbound data while attempting to get the stop command interleaved between the data.

As noted by the Digital I/O timing specification and Figure 3, the HMR2300 has a delayed response feature based on the programmed device ID in response to global address commands (*99....<cr>). Each HMR2300 will take its turn responding so that units do not transmit simultaneously (no contention). These delays also apply to the RS-232 interface versions of the HMR2300.

HMR2300

COMMAND INPUTS

A simple command set is used to communicate with the HMR2300. These commands can be automated; or typed in real-time while running communication software programs, such as a windows hyperterminal.

Command	Inputs ⁽¹⁾	Response ⁽²⁾	Bytes ⁽³⁾	Description
Format	*ddWE *ddA *ddWE *ddB	ASCII_ON↵ BINARY_ON↵	9 10	ASCII – Output Readings in BCD ASCII Format (Default) Binary – Output Readings in Signed 16-bit Binary Format
Output	*ddP *ddC Esc	{x, y, z reading} {x, y, z stream} {stream stops}	7 or 28 ... 0	P = Polled – Output a Single Sample (Default) C = Continuous – Output Readings at Sample Rate Escape Key – Stops Continuous Readings
Sample Rate	*ddWE *ddR=nnn	OK↵	3	Set Sample Rate to nnn Where: Nnn = 10, 20, 25, 30, 40, 50, 60, 100, 123, or 154 Samples/sec (Default = 20)
Set/Reset Mode	*ddWE *ddTN *ddWE *ddTF *ddWE *ddT	S/R_ON↵ S/R_OFF↵ {Toggle}	7 8 7 or 8	S/R Mode: TN – ON = Auto S/R Pulses (Default) TF – OFF = Manual S/R Pulses *ddT Toggles Command (Default = On)
Set/Reset Pulse	*dd]S *dd]R *dd]	SET↵ RST↵ {Toggle}	4 4 4] Character – Single S/R:]S -> SET = Set Pulse]R -> RST = Reset Pulse Toggle Alternates Between Set and Reset Pulse
Device ID	*99ID= *ddWE *ddID=nn	ID=_nn↵ OK↵	7 3	Read Device ID (Default = 00) Set Device ID Where nn = 00 to 98
Baud Rate	*99WE *99!BR=S *99WE *99!BR=F	OK↵ BAUD_9600↵ OK↵ BAUD=_19,200↵	14 14	Set Baud Rate to 9600 bps (Default) Set Baud Rate to 19,200 bps (8 bits, no parity, 1 stop bit)
Zero Reading	*ddWE *ddZN *ddWE *ddZF *ddWE *ddZR	ZERO_ON↵ ZERO_OFF↵ {Toggle}	8 9 8 or 9	Zero Reading Will Store and Use Current as a Negative Offset so That the Output Reads Zero Field *ddZR Toggles Command
Average Readings	*ddWE *ddVN *ddWE *ddVF *ddWE *ddV	AVG_ON↵ AVG_OFF↵ {Toggle}	7 8 7 or 8	The Average Reading for the Current Sample X(N) is: $X_{avg} = X(N)/2 + X(N-1)/4 + X(N-2)/8 + X(N-3)/16 + \dots$ *ddV Toggles Command
Re-Enter Response	*ddWE *ddY *ddWE *ddN	OK↵ OK↵	3 3	Turn the “Re-Enter” Error Response ON (*ddY) or OFF (*ddN). OFF is Recommended for RS-485 (Default = ON)
Query Setup	*ddQ	{See Desc.}	62-72	Read Setup Parameters. Default: ASCII, POLLED, S/R ON, ZERO OFF, AVG OFF, R ON, ID=00, 20 sps
Default Settings	*ddWE *ddD	OK↵ BAUD=_9600↵	14	Change All Command Parameter Settings to Factory Default Values
Restore Settings	*ddWE *ddRST	OK↵ BAUD=_9600↵ or BAUD=_19,200↵	14 16	Change All Command Parameter Settings to the Last User Stored Values in the EEPROM
Serial Number	*dd#	SER#_nnnn↵	22	Output the HMR2300 Serial Number
Software Version	*ddF	S/W_ver:_nnnn↵	27	Output the HMR2300 Software Version Number
Hardware Version	*ddH	H/W_ver:_nnnn↵	19	Output the HMR2300 Hardware Version Number
Write Enable	*ddWE	OK↵	3	Activate a Write Enable. This is required before commands: Set Device ID, Baud Rate, and Store Parameters.
Store Parameters	*ddWE *ddSP	DONE↵ OK↵	8	This writes all parameter settings to EEPROM. These values will be automatically restored upon power-up.
Too Many Characters	Wrong Entry	Re-enter↵	9	A command was not entered properly or 10 characters were typed after an asterisk (*) and before a <cr>.
Missing WE Entry	Write Enable Off	WE_OFF↵	7	This error response indicates that this instruction requires a write enable command immediately before it.

(1) All inputs must be followed by a <cr> carriage return, or Enter, key. Either upper or lower case letters may be used. The device ID (dd) is a decimal number between 00 and 99. Device ID = 99 is a global address for all units.

(2) The “↵” symbol is a carriage return (hex 0D). The “_” sign is a space (hex 20). The output response will be delayed from the end of the carriage return of the input string by 2 msec (typ.), unless the command sent as a global device ID = 99.

HMR2300

DATA FORMATS

The HMR2300 transmits each X, Y, and Z axis as a 16-bit value. The output data format can be either 16-bit signed binary (sign plus 15 bits) or a binary coded decimal (BCD) ASCII characters. The command *ddA will select the ASCII format and *ddB will select the binary format.

The order of output for the binary format is X_{hi}, X_{lo}, Y_{hi}, Y_{lo}, Z_{hi}, Z_{lo}. The binary format is more efficient for a computer to interpret since only 7 bytes are transmitted. The BCD ASCII format is easiest for user interpretation but requires 28 bytes per reading. There are limitations on the output sample rate (see table below) based on the format and baud rate selected. Examples of both binary and BCD ASCII outputs are shown below for field values between ± 2 gauss.

Field (gauss)	BCD ASCII Value	Binary Value (Hex)	
		High Byte	Low Byte
+2.0	30,000	75	30
+1.5	22,500	57	E4
+1.0	15,000	3A	98
+0.5	7,500	1D	4C
0.0	00	00	00
-0.5	-7,500	E2	B4
-1.0	-15,000	C3	74
-1.5	-22,500	A8	1C
-2.0	-30,000	8A	D0

Binary Format: 7 Bytes

X_H | X_L | Y_H | Y_L | Z_H | Z_L | <cr>

X_H = Signed Byte, X axis

X_L = Low Byte, X axis

<cr> = Carriage Return (Enter key), Hex Code = 0D

ASCII Format: 28 Bytes

SN | X1 | X2 | CM | X3 | X4 | X5 | SP | SP | SN | Y1 | Y2 | CM | Y3 | Y4 | Y5 | SP | SP | SN | Z1 | Z2 | CM | Z3 | Z4 | Z5 | SP | SP | <cr>

The ASCII characters will be readable on a monitor as sign decimal numbers. This format is best when the user is interpreting the readings.

PARAMETER SELECTION VERSUS OUTPUT SAMPLE RATE

Sample Rate (sps)	ASCII		Binary		f _{3dB} (Hz)	Notch (Hz)	Command Input Rate – min. (msec)
	9600	19,200	9600	19,200			
10	yes	yes	yes	yes	17	50/60	20
20	yes	yes	yes	yes	17	50/60	20
25	yes	yes	yes	yes	21	63/75	16
30	yes	yes	yes	yes	26	75/90	14
40	no	yes	yes	yes	34	100/120	10
50	no	yes	yes	yes	42	125/150	8
60	no	no	yes	yes	51	150/180	7
100	no	no	yes	yes	85	250/300	4
123	no	no	no	yes	104	308/369	3.5
154	no	no	no	yes	131	385/462	3

HMR2300

DEVICE ID

The Device ID command (*ddID=nn) will change the HMR2300 ID number. A Write Enable (*ddWE) command is required before the device ID can be changed. This is required for RS-485 operation when more than one HMR2300 is on a network. A Device ID = 99 is universal and will simultaneously talk to all units on a network.

BAUD RATE COMMAND

The Baud Rate command (*dd!BR=F or S) will change the HMR2300 baud rate to either fast (19,200 baud) or slow (9600 baud). A Write Enable (*ddWE) command is required before the baud rate can be changed. The last response after this command has been accepted will be either BAUD=9600 or BAUD=19,200. This will indicate to the user to change to the identified new baud rate before communications can resume.

ZERO READING COMMAND

The Zero Reading command (*ddZN) will take a magnetic reading and store it in the HMR2300's microcontroller. This value will be subtracted from subsequent readings as an offset. The zero reading will be terminated with another command input(*ddZF) or a power down condition. This feature is useful for setting a reference attitude or nulling the earth's field before anomaly detection.

SET/RESET AND AVERAGE COMMANDS

The set-reset function generates a current/magnetic field pulse to each sensor to realign the permalloy thin film magnetization. This yields the maximum output sensitivity for magnetic sensing. This pulse is generated inside the HMR2300 and consumes less than 1mA typically. The Set/Reset Mode command (*ddTN or *ddT) activates an internal switching circuit that flips the current in a "Set" and "Reset" condition. This cancels out any temperature drift effects and ensures the sensors are operating in their most sensitive region.

Fluctuations in the magnetic readings can be reduced by using the Average Readings commands (*ddVN or *ddV). These commands provide a low pass filter effect on the output readings that reduces noise due to Set/Reset switching and other environmental magnetic effects. The two figures below show the average readings effect for step and impulse responses.

Switching the set-reset state is not required to sense magnetic fields. A single Set (or Reset) pulse will maximize the output sensitivity and it will stay that way for months or years. To turn off the internal switching, enter the command *ddTF or *ddT. In this state the sensors are either in a Set or Reset mode. If the HMR2300 is exposed to a large magnetic field (>10 gauss), then another set pulse is required to maximize output sensitivity.

In the Set mode, the direction of the sensitive axis' are shown on the enclosure label and the board dimensions figure. In the Reset mode, the sensitive field directions are opposite to those shown. By typing *dd], the user can manually activate a Set or Reset pulse. The S/R pulse commands can be used the continuous read mode to flip between a Set and Reset state. Note that the first three readings immediately after these commands will be invalid due to the uncertainty of the current pulse to the sensor sample time.

DEFAULT AND RESTORE COMMANDS

The Default Settings command (*ddD) will force the HMR2300 to all the default parameters. This will not be a permanent change unless a Store Parameter command (*ddSP) is issued after the Write Enable command. The Restore Settings command (*ddRST) will force the HMR2300 to all the stored parameters in the EEPROM.

HMR2300

OUTPUT SAMPLE RATES

The sample rate can be varied from 10 samples per second (sps) to 154 sps using the *ddR=nnn command. Each sample contains an X, Y, and Z reading and can be outputted in either 16-bit signed binary or binary coded decimal (BCD) ASCII. The ASCII format shows the standard numeric characters displayed on the host computer display. Some sample rates may have restrictions on the format and baud rate used, due to transmission time constraints.

There are 7 Bytes transmitted for every reading binary format and 28 Bytes per reading in ASCII format. Transmission times for 9600 baud are about 1 msec/Byte and for 19,200 baud are about 0.5msec/Byte. The combinations of format and baud rate selections are shown in the above Table. The default setting of ASCII format and 9600 baud will only transmit correctly up to 30 sps. Note the HMR2300 will output a higher data settings, but the readings may be incorrect and will be at a lower output rate than selected.

For higher sample rates (>60 sps), it is advised that host computer settings for the terminal preferences be set so a line feed <lf> is not appended to the sent commands. This slows down the reception of data, and it will not be able to keep up with the incoming data stream.

INPUT SIGNAL ATTENUATION

Magnetic signals being measured will be attenuated based on the sample rate selected. The bandwidth, defined by the 3dB point, is shown in the above Table for each sample rate. The default rate of 20 sps has a bandwidth of 17Hz. The digital filter inside the HMR2300 is the combination of a comb filter and a low pass filter. This provides a linear phase response with a transfer function that has zeros in it.

When the 10 or 20 sps rate is used, the zeros are at the line frequencies of 50 and 60 Hz. These zeros provide better than 125 dB rejection. All multiples of the zeros extend throughout the transfer function. For example, the 10 and 20 sps rate has zeros at 50, 60, 100, 120, 150, 180, ... Hz. The multiples of the zeros apply to all the sample rates against the stated notch frequencies in the above Table.

COMMAND INPUT RATE

The HMR2300 limits how fast the command bytes can be received based on the sample rate selected. The above Table shows the minimum time between command bytes for the HMR2300 to correctly read them. This is usually not a problem when the user is typing the commands from the host computer. The problem could arise from an application program outputting command bytes too quickly.

CIRCUIT DESCRIPTION

The HMR2200 Smart Digital Magnetometer contains all the basic sensors and electronics to provide digital indication of magnetic field strength and direction. The HMR2300 has all three axis of magnetic sensors on the far end of the printed circuit board, away from the J1 and J2 connector interfaces. The HMR2300 uses the circuit board mounting holes or the enclosure surfaces as the reference mechanical directions. The complete HMR2300 PCB assembly consists of a mother board, daughter board, and the 9-pin D-connector (J1).

The HMR2300 circuit starts with Honeywell HMC2003 3-Axis Magnetic Sensor Hybrid to provide X, Y, and Z axis magnetic sensing of the earth's field. The HMC2003 contains the AMR sensing bridge elements, a constant current source bridge supply, three precision instrumentation amplifiers, and factory hand-selected trim resistors optimized for performance for magnetic field gain and offset. The HMC2003 is a daughter board that plugs into the HMC2300 motherboard, and the hybrid analog voltages from each axis is into analog multiplexors and then into three 16-bit Analog to Digital Converters (ADCs) for digitization. No calibration is necessary as the HMC2003 hybrid contains all the compensation for the sensors, and the set/reset routine handles the temperature drift corrections. A microcontroller integrated circuit receives the digitized magnetic field values (readings) by periodically querying the ADCs and performs any offset corrections. This microcontroller also performs the external serial data interface and other housekeeping functions. An onboard EEPROM integrated circuit is employed to retain necessary setup variables for best performance.

The power supply for the HMR2300 circuit is regulated +5 volt design (LM2931M) with series polarity power inputs diodes in case of accidental polarity reversal. A charge pump circuit is used to boost the regulated voltage for the set/reset pulse function going to the set/reset straps onboard the HMC2003. Transient protection absorbers are placed on the TD, RD, and V+ connections to J1.

HMR2300

APPLICATIONS PRECAUTIONS

Several precautions should be observed when using magnetometers in general:

- The presence of ferrous materials, such as nickel, iron, steel, and cobalt near the magnetometer will create disturbances in the earth's magnetic field that will distort the X, Y, and Z field measurements.
- The presence of the earth's magnetic field must be taken into account when measuring other magnetic fields.
- The variance of the earth's magnetic field must be accounted for in different parts of the world. Differences in the earth's field are quite dramatic between North America, South America and the Equator region.
- Perming effects on the HMR2300 circuit board need to be taken into account. If the HMR2300 is exposed to fields greater than 10 gauss, then it is recommended that the enclosure/circuit boards be degaussed for highest sensitivity and resolution. A possible result of perming is a high zero-field output indication that exceeds specification limits. Degaussing wands are readily available from local electronics tool suppliers and are inexpensive. Severe field offset values could result if not degaussed.

NON-FERROUS MATERIALS

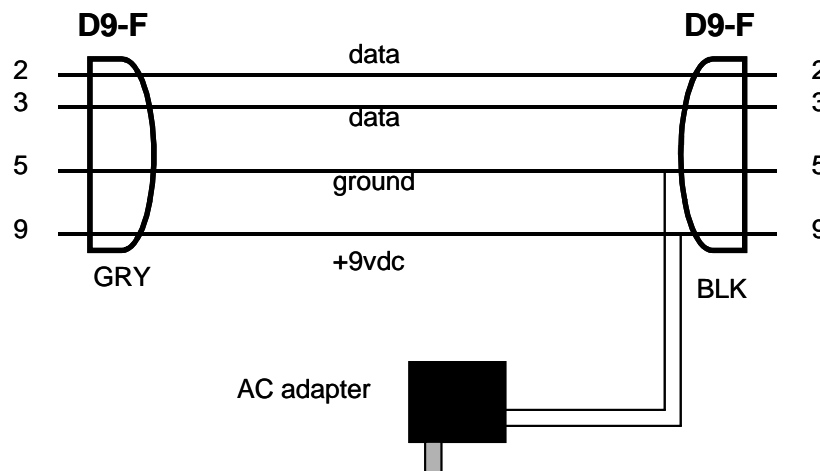

Materials that do not affect surrounding magnetic fields are: copper, brass, gold, aluminum, some stainless steels, silver, tin, silicon, and most non-metals.

HANDLING PRECAUTIONS

The HMR2300 Smart Digital Magnetometer measures fields within 2 gauss in magnitude with better than 0.1 milli-gauss resolution. Computer floppy disks (diskettes) store data with field strengths of approximately 10 gauss. This means that the HMR2300 is many times more sensitive than common floppy disks. Please treat the magnetometer with at least the same caution as your diskettes by avoiding motors, CRT video monitors, and magnets. Even though the loss of performance is recoverable, these magnetic sources will interfere with measurements.

DEMONSTRATION PCB MODULE KIT

The HMR2300 Demonstration Kit includes additional hardware and Windows software to form a development kit for with the smart digital magnetometer. This kit includes the HMR2300 PCB and enclosure, serial port cable with attached AC adapter power supply, and demo software plus documentation on a compact disk (CD). The figure below shows the schematic of the serial port cable with integral AC adapter. There will be three rotary switches on the AC adapter. These should be pointed towards the positive (+) polarity, +9 volts, and 120 or 240 VAC; depending your domestic supply of power.
